

Story set up:

DEMO LINK BY NINGDAN:

Pearson Demo Script: “Unlocking Every Student’s Potential”

Setting:

“Today, we’re going to explore a modern, AI-powered experience inspired by Pearson”

Vignette 1: Personalized Entry Point		
Script	Screen	Aha moment
We begin with a teacher logging into Pearson. This greeting isn't static, it reflects recent activity and highlights opportunities.	“Welcome back, Professor Carter.” “Your Intro to Biology course shows strong engagement this week.” secondary line: “12 assignments submitted since your last session.”	The system understands who you are AND what matters right now
At the center of the experience is a single, unified prompt bar. No separate search or chat—just one place to start.	Unified Prompt Bar	
As the user clicks into the prompt bar, personalized suggestions appear instantly.	Show typeahead recommendation and hover state	
“If we switch to an administrator, the experience adapts.”	Show greeting and pills for an administrator	
Vignette 2: Intelligent Prompting (Pills as the new Homepage)		
Instead of a traditional homepage filled with links and menus, everything starts right here. These pills represent the core things an educator wants to do—not how the system is structured. Also, this whole experience can be personalized per role by setting up the pills by user profile	Pills visible (Teacher): 1. Design Learning 2. Take Action 3. Understand Learners 4. Communicate & Support 5. Recommended for You	This replaces the homepage—navigation is now intent-based, not menu-based.
Let's start with a teacher's view. Each pill acts as a gateway into a set of guided prompts. For example, under Design Learning, we guide teachers towards designing new learning experiences	Cursor clicks “Design Learning” Teacher suggestions appear: “Create a new module for this course” “Design an advanced assignment”	

	"Build a quiz for the next unit" "Explore recommended course content"	
Now let's look at everyday work.	Click Take Action Suggestions update: - "Assign content to students" - "Grade recent submissions" - "Publish next module" - "Update assignment deadlines"	
We can also quickly understand how learners are progressing.	Click Understand Learners Suggestions: - "Summarize learner progress this week" - "Show engagement by module" - "Identify learners falling behind or excelling" - "Review assessment performance"	
And communication is built directly into the experience.	Click Communicate & Support Suggestions: - "Send announcement to students" - "Provide feedback on recent work" - "Message learners who need support" - "Share course updates"	
Now, this is where things get really interesting. This pill is dynamic, it updates in real time based on what's happening.	Cursor moves to "Recommended for You " This pill is visually distinct: Slight glow or accent color and it has these recommendations: "Identify learners ready for the next module" KA: "Best practices for structuring course modules" "What's the best way to introduce advanced content?" KA: "Designing engaging learning experiences"	The system helps you know what to ask and where to start.
Vignette 3: From prompt→ answer→ action		
Now let's select one of these prompts and see how the system reacts	Click: Identify learners ready for the next module"	
Instead of returning a list of links, we get a synthesized answer. This summary is powered by multiple data sources—not just one report."	Answer: The system returns the names of 3 students ready for the next module: "Sophia Patel, Noah Kim and Isabella Thompson are ready for the next module"	

	The card shows images for the three students, the names as well as their learning style: Auditory for Sophia, reading and writing for NOah Kim and Visual for Isabella” in addition with an explanation on why: “Learners ready for the next module typically demonstrate consistent performance above benchmarks, high engagement with current materials, and strong assessment results...” Below summary, show source chips / citations: - How to Identify Students ready for the next module - Assignment Completion - Engagement Metrics	
And if I want to go deeper, I can click into any of these sources.	Cursor hovers over a citation (no click yet—save for next vignette). Tooltip: “Engagement Metrics”	
But here’s where the experience really changes. The system doesn’t just give me insight—it suggests what I can do next.	Below summary appears Action Section, after a transition statement: Here are some ways you can help students continue to grow: 3–4 consumer-grade tiles/cards: - Assign Next Module - Provide Targeted Support - Send Encouragement Message Each tile has: - Icon - Short description - CTA button	
Let’s “Assign Next Module”	Cursor clicks : Assign next module	Transition from insight → execution.
Notice—the system has already done the work for me.All I need to do is review and confirm.	Fields pre-filled: - Learners auto-selected (based on query) - Module suggested - Due date pre-populated Primary CTA button visible: “Assign Module” Editable fields visible	Removes friction—zero manual setup.
And when I submit...the system doesn’t stop—it moves me forward automatically.	Smooth transition: - First tile shows completed state (checkmark)	Workflow continues without user navigation.

	- Second tile becomes active: “Notify Learners”	
In this case, the next logical step is communication.	Pre-filled message UI: - Recipients auto-selected (parents + students) - Message drafted: “You’ve been assigned the next module based on your progress...” Show editable message field + preview	
All I need to do is confirm.	User clicks Send Notification	
And just like that, the process is complete.	Completion state: - “Module Assigned” - “Notifications sent”	
Vignette 4: Deep Dive with Agentic Assistance (Context Travels with You)		
Now let’s explore one of these data sources in more detail.	Cursor moves to a citation and clicks	
Now let’s take a closer look at the data behind the recommendation	From previous screen, cursor clicks a citation: “How to identify learners available for the next module”	
But notice—this isn’t a traditional page. On the right, I can now see the underlying learner performance data. And on the left, we now have an intelligent assistant. Importantly, the assistant already knows what we’ve been working on.	Transition to record detail page: Here the instructor is able to review the knowledge article on how to assess student readiness without losing context Layout splits into two sections: - Right (70%): Main content (student performance data) - Left (30%): Agent panel (persistent assistant)	
So I can continue the conversation naturally. Prof Carter wants to look deeper into	“Type: Look at Sophia’s performance”	
And the system responds with deeper insight. At this point, the system now understands much more. And now—this is where the experience adapts.	New Card Shows Sophia’s recent assessments . New Card appears on the left: We see Sophia’s progress in Biology starting with the new module she was assigned to showing as (not started) and the modules - “Advanced Biology instruction strategies for Module 3” (not started) - “Common misconceptions in cellular biology” Completed (10/10) - “Basics of biology mastery” (10/10) Page on the right refreshes to show Sophia’s student record	

"Now let's move into something more structured and long-running."	Transition cue for next vignette	
Vignette 5:Structured Workflow (UC item)		Deprioritized - fast follow after May 9th
So far, everything we've done has been fast and conversational. But not all work looks like that. Some tasks are more structured and happen over time, such as some unified catalog items.	User types: Create new course module	
For those, the experience adapts. We move into a focused workspace designed for step-by-step completion.	Create new module (UC item) is suggested as a tile. When the customer clicks on it, a new tab opens with the screenflow	
Here, I'm guided through a clear process.	Stepper visible: 1. Define Module 2. Add Content 3. Review 4. Submit	
I can quickly move through and submit this	User clicks through quickly → Submit	
Now this becomes a longer-running process.	Status view appears: - "Under Review" or "Scheduled" - Status badge + timestamp	
Not everything should happen instantly—and that's by design. The system adapts based on the type of work.		
Vignette 6		
Now let's see how this experience continues beyond the desktop.	Mobile device	
As an instructor, I'm not always at my desk. And the system keeps me informed.	Push notification appears: "Your module 'Advanced Biology Concepts' has been approved."	
I can jump right back into the experience.	User taps notification	
"Instead of navigating through menus, I get a quick summary.	Mobile view loads: - Condensed summary card: "Your module is now live and available to learners."	
And just like on desktop, I can take action immediately	Action tiles (mobile-optimized): - "View Module" - "Notify Learners" - "Review Submissions"	
	User taps:	

"Let's notify learners that the module is now available."	Notify Learners	
The system prepares everything for me.	Pre-filled mobile-friendly screen: - Message drafted - Recipients selected - Channel pre-selected	
All I need to do is confirm.	Tap Send	
And just like that, I've completed the task—from my phone.	Success state: - "Notification sent"	
Now let's look at how this experience supports me when I need a little extra help.	Transition setup	
Vignette 7:		
Let's look at one more everyday scenario. Sometimes, I just have a quick question. As I start typing, the system begins guiding me.	r types: and deadline..." Peahead dropdown ears: Suggestions include: "How do I extend an assignment deadline?" "Guide: Managing assignment deadlines" "Can I grant extensions to specific learners?"	
Even before I finish typing, I get helpful suggestions.	Hover over first suggestion: - Subtle highlight - Slight elevation / glow	
I can either ask the question or jump straight into what I want to do.	Below typeahead, action tiles appear (after selection or Enter): - Extend Deadline - Grant Individual Extension	
Let's go ahead and extend the deadline.	User selects: Extend Deadline	
The system prepares everything for me	Simple workflow (inline): - Assignment pre-selected - Current deadline shown - Suggested new date populated	

I just make a quick adjustment.And submit	User tweaks date slightly.Click Confirm / Update Deadline	
Done—quick and easy.	Success state: - "Deadline updated"	
Now let's say I have a slightly more nuanced question.	User types: "What's the best way to handle extensions fairly?" and hits enter	
I get an answer and action suggestions	Prof Carter is given options to: Review knowledge articles or to chat to a specialist. He decides to chat with a specialist. "Chat with a specialist" (tile)	
can move directly into a conversation with a Pearson expert.	Chat panel opens (human agent): Agent intro: "Hi Professor Carter, I see you're asking about assignment extensions—happy to help."
